

Featherweight Champion uses HBOT to heal Injuries following his fight

August 3rd, 2010

Urijah Faber used hyperbaric oxygen to heal post-fight trauma

April 26, 2010 (MMD Newswire) — On Saturday night, April 24th, featherweight champion Jose Aldo pummeled Urijah Faber's left leg for 25-cruel minutes in front of Faber's hometown Sacramento WEC supporters. Aldo landed a several debilitating kicks to Faber's lead leg in the fight's first two rounds.

Dr. Stoller, medical director of the Hyperbaric Oxygen Clinic of Sacramento, helped Faber, "The California Kid," heal his broken hand last year utilizing a medical therapy that has become increasingly popular with professional athletes. Hyperbaric Oxygen (100% Oxygen delivered in a high pressure environment) accelerates the body's ability to repair itself and in many cases allows for a healing that would not have been possible without the hyperbaric oxygen (HBOT).

"HBOT is the same therapy we are now starting to use on Iraqi and Afgan war vets who experience TBI/PTSD (see www.hyperbaricmedicalassociation.org)," Stoller said.

Stoller was watching the fight live in Sacramento and knew he would need to open the hyperbaric clinic up. Clinic manager, Mike Greenhalgh, was there waiting for Faber as he arrived at midnight to treat the traumatized muscles of his left leg.

Faber continues to be one of the world's best mixed martial artists and the rapid healing of his injuries using HBOT has made sure he can minimize the trauma to his body from fighting and will regain his former title on another day.
